## MATERIAL & RESOURCES (MR)

### RECYCLED CONTENT

#### MR CREDIT 4

(NC - 1-2 points Schools - 1-2 points, CS - 1-2 points)

#### Intent

To increase demand for building products that incorporate recycled content materials, thereby reducing impacts resulting from extraction and processing of virgin materials.

#### Requirements NC, SCHOOLS & CS

Use materials with recycled content(1) such that the sum of postconsumer(2) recycled content plus 1/2 of the postconsumer(3) content constitutes at least 10% or 20%, based on cost, of the total value of the materials in the project. The minimum percentage materials recycled for each point threshold is as follows:

Recycled Content	Points
10%	1
20%	2

The recycled content value of a material assembly is determined by weight. The recycled fraction of the assembly is then multiplied by the cost of assembly to determine the recycled content value.

Mechanical, electrical and plumbing components, and specialty items such as elevators cannot be included in this calculation. Include only materials permanently installed in the project. Furniture may be included if it is included consistently in MR Credit 3: Materials Reuse through MR Credit 7: Certified Wood (MR Credit 6 in Core & Shell)

1. Recycled content is defined in accordance with the International Organization of Standards document, ISO 14021 "Environmental labels and declarations - Self-declared environmental claims (Type II environmental labeling)". 2. Postconsumer material is defined as waste material generated by households or by commercial, industrial and institutional facilities in their role as end-users of the product, which can no longer be used for its intended purpose. 3. Preconsumer material is defined as material diverted from the waste stream during the manufacturing process. Reutilization of materials (i.e., rework, regrind or scrap generated in a process and capable of being reclaimed within the same process that generated it) is excluded.
